

Rotary Kiln

<u>Rotary kiln</u> is a pyroprocessing device used to raise materials to a high temperature (calcination) in a continuous process. Materials produced using rotary kiln include: Cement,

Lime, Refractories, Metakaolin, Titanium dioxide, Alumina.

<u>Great Wall</u> can produce rotary kiln with diameter $\Phi 1-\Phi 5m$, which is widely used in metallurgy, steel, chemical, refractory, ceramsite, papermaking industries. The <u>rotary kiln</u> supporting has rolling and sliding type and the drive can use DC or AC variable frequency control. It has various seal types for different working condition. Great Wall can also design and customize non-standard rotary kiln according to customer's special requirements.

Working principle:

Material will be feed into kiln tail through chute in gas chamber. As kiln shell is inclined and it rotates slightly, material will move along round shell and will also move along shaft direction from kiln tail to kiln head. Material will be processed through pre-heat, decompose, calcined and will be feed into cooler. Fuel will be

given through gas or coal burner at kiln head and will be combusted in kiln. Heat will be transferred to material by fire radiate, hot air flow, kiln brick transfer. The heat will heat and calcined material enough and make it final product.

Specifications:
